REPRODUCIBLE RESEARCH

To support reproducible research, my students and I create and maintain well documented open-source software as part of my research output. The developed software consists of several R-extension packages¹ and is published via the Comprehensive R Archive Network (<http://CRAN.R-project.org>) or as part of the Bioconductor project for bioinformatics (<http://www.bioconductor.org/>). Development versions and prototypes are maintained on GitHub (<http://github.com/mhahsler>).

The software is very popular to support data science and analytics in research, educational and industrial settings. The most popular package (arules) was installed more than 15,000 times in January 2017. All packages together exceed 50,000 installs per month.
